1. Problem Statement	. 3
2. Solution	3

1. Problem Statement

Use the given link below:

https://archive.ics.uci.edu/ml/machine-learning-databases/00304/

Problem- prediction of the number of comments in the upcoming 24 hours on those blogs, the train data was generated from different base times that may temporally overlap. Therefore, if you simply split the train into disjoint partitions, the underlying time intervals may overlap. Therefore, the you should use the provided, temporally disjoint train and test splits to ensure that the evaluation is fair.

- a) Create a linear regression model to predict the number of comments in the next 24 hours (relative to base time).
- b) Fine tune the model and represent important features Visualize the dataset and make inferences from that.
- c) Interpret the summary of the linear model.
- d) Report the test accuracy vs. the training accuracy

2. Solution

a) Create a linear regression model to predict the number of comments in the next 24 hours (relative to base time).

The R-script for the given problem is as follows:

```
library(foreach)
library(readr)
library(dplyr)
library(corrplot);library(car); library(MASS); library(ggplot2)
library(reshape2); library(forecast)

setwd("E:/munmun_acadgild/acadgild data analytics/supporting files/BlogFeedback")
getwd()

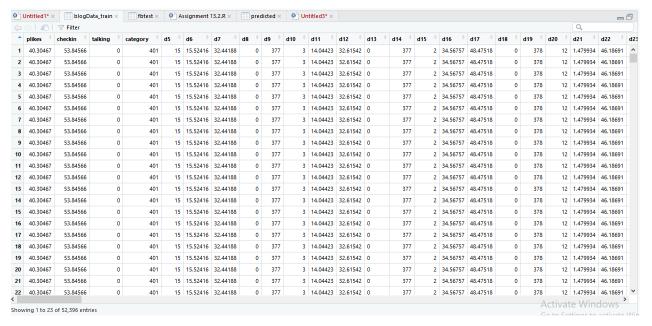

blogData_train <- read_csv("E:/munmun_acadgild/acadgild data analytics/supporting files/BlogFeedback/blogData_train.csv")
```

```
# retrieve filenames of test sets
test_filenames = list.files(pattern = "blogData_test")
# load and combine dataset
train = fread("blogData_train.csv")
fbtest = foreach(i = 1:length(test_filenames), .combine = rbind) %do% {
 temp = fread(test_filenames[i], header = FALSE)
# Assign variable names to the train and test data set
colnames(blogData train) <-

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' '1
Residual standard error: 67.27 on 52366 degrees of freedom
Multiple R-squared: 0.4976, Adjusted R-squared: 0.4973
F-statistic: 1788 on 29 and 52366 DF, p-value: < 2.2e-16
```

Conclusion/Interpretation:

A linear regression model is created to predict the number of comments in the next 24 hours (relative to base time) and following observation is obtained:

Residual standard error: 67.27 on 52366 degrees of freedom Multiple R-squared: 0.4976, Adjusted R-squared: 0.4973 F-statistic: 1788 on 29 and 52366 DF, p-value: < 2.2e-16

b. Fine tune the model and represent important features Visualize the dataset and make inferences from that.

The R-script for the given problem is as follows:

```
final_model <- lm(target ~ talking + d5 + d7 + d8 + d10 + d11 + d12 + d13 + d16 + d17 + d19 + d20 + d22 + d23 + cc1 + cc2 + cc3 + cc4 + basetime + postshre + Hhrs, data = train) summary(final_model)

prediction <- predict(final_model, test)
predicted <- data.frame(cbind(actuals = test$target, prediction = prediction))
predicted$prediction <- ifelse(prediction<0, 0, round(prediction,0))
cor(predicted)

View(predicted)
```

The output of the R-Script (from Console window) is given as follows:

```
> final_model <- lm(target \sim talking + d5 + d7 + d8 + d10 + d11 +
                      d12 + d13 + d16 + d17 + d19 + d20 + d22 + d23 +
+
                      cc1 + cc2 + cc3 + cc4 + basetime + postshre +
Hhrs, data = train)
> summary(final_model)
call:

d. Report the test accuracy vs. the training accuracy

The R-script for the given problem is as follows:

Multiple R-squared: 0.4976,

```
# test accuracy
round(accuracy(predicted$prediction,predicted$actuals),3)
prediction <- predict(final_model, test)
predicted <- data.frame(cbind(actuals = test$target, prediction = prediction))</pre>
```

F-statistic: 2730 on 19 and 52376 DF, p-value: < 2.2e-16

Adjusted R-squared: 0.4974

```
predicted$prediction <- ifelse(prediction<0, 0, round(prediction,0))</pre>
min max accuracy <- mean(apply(predicted, 1, min) / apply(predicted, 1, max))
# training accuracy
round(accuracy(predicted$prediction,predicted$actuals),3)
prediction <- predict(final_model, train)</pre>
predicted <- data.frame(cbind(actuals = train$target, prediction = prediction))
predicted$prediction <- ifelse(prediction<0, 0, round(prediction, 0))
min max accuracy <- mean(apply(predicted, 1, min) / apply(predicted, 1, max))
The output of the R-Script (from Console window) is given as follows:
> # test accuracy
> round(accuracy(predicted$prediction,predicted$actuals),3)
              ME RMSE MAE MPE MAPE
Test set -0.007 67.251 27.405 -Inf Inf
